# WHY FAST BREAST MRI?

An additional screening test could be the difference between early and late-stage diagnosis for your patients.

The Fast Breast MRI is a supplemental screening test for women of average to intermediate risk for developing breast cancer with dense breast tissue. It is an abbreviated version of a regular Breast MRI, which is used to screen women who are at high risk (such as women with the BRCA 1 and BRCA 2 breast cancer genes).

**YOU CAN REFER YOUR PATIENTS FOR A FAST BREAST MRI AT MEDRVA.**

## Benefits include:

- Increased detection rate of over 2.5x that of a traditional mammogram.
- Scheduling with little-to-no wait times.
- Receive results quickly.
- Convenient location and appointment complete in less than an hour.
- Patient out-of-pocket cost of \$299.

*A Fast Breast MRI screening is not intended to replace mammography. As it remains the standard of care, an annual mammogram is recommended for women over 40. An additional screening test for breast cancer can give your patients peace of mind. Please be aware that insurance does not cover Fast Breast MRI.*
